

# CSC236 fall 2018

## recursive time complexity

difficult road to laziness...  
...we'll get there next week...

Danny Heap

heap@cs.toronto.edu / BA4270 (behind elevators)

416-978-5899

Using Introduction to the Theory of Computation,  
Chapter 3

# binary search

Recursive  $T(n)$

correctness.... later  
worst-case time complexity

$$n = \text{len}(A[b:e+1]) = e-b+1$$

x: value to be searched for  
A: array  
b: beginning index  
e: end index

```
def recBinSearch(x, A, b, e) :
```

```
    if b == e :  $c1 \setminus \ln \setminus R^+$ 
```

```
        if x <= A[b] :  $c2$ 
```

```
            return b
```

```
        else :
```

```
            return e + 1
```

```
    else :
```

```
        m = (b + e) // 2 # midpoint
```

```
        if x <= A[m] :
```

```
            return recBinSearch(x, A, b, m)
```

```
        else :
```

```
            return recBinSearch(x, A, m+1, e)
```

sum =  $c'$

$c3 = \max$

$$T(n) = \begin{cases} 1 & \text{if } n = 1 \\ 1 + \max(T(\text{ceiling}(n/2)), T(\text{floor}(n/2))) & \end{cases}$$

$c'' \dots = 1$  (choosing units of  $c''$ ).

exercise to reader: show that  $m-b+1 = \text{ceiling}(n/2)$ , and  $e-(m+1)+1 = \text{floor}(n/2)$   
show that  $T$  is nondecreasing

# guess bound on $T(n)$ ... by unwinding/substitution

suppose  $n = 2^k$ , for some natural number  $k$  (bigger than 0, for now).

$$\begin{aligned}T(n) &= T(2^k) = 1 + T(2^{k-1}) \\&= 1 + 1 + T(2^{k-2}) = 2 + T(2^{k-2}) \\&= 3 + T(2^{k-3}) \\&\dots \text{ intuition happens here!} \\&= k + T(2^{k-k}) = \lg(n) + c'\end{aligned}$$

conjecture:  $T \in \Theta(\lg)$

want to prove  $T \in \Omega(\lg)$  [then big-Oh later...]

# prove lower bound on $T(n)$

Let  $c = ???$  1. Then  $c \in \mathbb{R}^+$ . Let  $B = ???$  2. Then  $B \in \mathbb{R}^+$ .

(complete induction)

Let  $n$  be an arbitrary natural number no smaller than  $B$ . Assume  $\forall B \leq i < n, T(i) \geq c \lg(i)$ . I will show that  $T(n) \geq c \lg(n)$ .

$$\begin{aligned} \text{case } n \geq 3: T(n) &= 1 + T(\lceil n/2 \rceil) && \# \text{ since } n \geq B > 1 \\ &\geq 1 + c \lg(\lceil n/2 \rceil) && \# \text{ by IH, since } B \leq \lceil n/2 \rceil < n, \text{ since } n \geq 3 \\ &\geq 1 + c \lg(n/2) && \# \text{ since } \lg \text{ nondecreasing} \\ &= 1 + c(\lg(n) - \lg(2)) = 1 - c + c \lg(n) \\ &\geq c \lg(n) && \# \text{ since } c \leq 1 \end{aligned}$$

$$\text{base case } n = 2: \text{ Then } T(2) = 1 + T(1) = 1 + c' \geq c \lg(2) = c \quad \# \text{ since } c = 1$$

# try to prove upper bound on $T(n)$

trouble!?!

Let  $c = ???$ . Then  $c \in \mathbb{R}^+$ . Let  $B = n ???$ . Then  $B \in \mathbb{R}^+$ .

(complete induction)

Let  $n$  be an arbitrary natural number no smaller than  $B$ . Assume (IH)  $\forall$  for all  $B \leq i < n$ ,  $T(i) \leq c \lg(i)$ . I will try to show that  $T(n) \leq c \lg(n)$ .

case  $n \geq B$ :  $T(n) = 1 + T(\lceil n/2 \rceil)$  # since  $n \geq B > 1$   
 $\leq 1 + c \lg(\lceil n/2 \rceil)$  # by IH, since  $B \leq \lceil n/2 \rceil < n$ , since  $n > 2$   
 $\leq 1 + c \lg((n+1)/2)$  # since  $\lg$  is nondecreasing  
 $= 1 + c(\lg(n+1) - 1) = 1 - c + c \lg(n+1)$   
 $\leq c \lg(n)$ .....darn!

strengthen the claim:  $T(n) \leq c \lg(n-1)$

case  $n \geq B$ :  $T(n) = 1 + T(\lceil n/2 \rceil)$  # since  $n \geq B > 1$   
 $\leq 1 + c \lg(\lceil n/2 \rceil - 1)$  # by IH, since  $B \leq \lceil n/2 \rceil < n$ , since  $n > 2$   
 $\leq 1 + c \lg((n+1)/2 - 1)$  # since  $\lg$  is nondecreasing  
 $= 1 + c \lg((n+1-2)/2) = 1 + c \lg((n-1)/2) = 1 + c(\lg(n-1) - 1)$   
 $= 1 - c + c \lg(n-1)$   
 $\leq c \lg(n-1)$  # since  $c > 1$

case  $n = 2$ :  $T(2) = 1 + c' \leq c \lg(1)$ .....won't work

case  $n = 3$ :  $T(3) = 1 + T(2) = 2 + c' \leq c \lg(2) = c$  # true since  $c = 2 + c'$

,
